JAVASCRIPT ASSIGNMENT : 02

Module 2: JavaScript Setup & Basics – Assignment Questions

---

1. Demonstrate all three ways of adding JavaScript to HTML

Create a single HTML file where you use inline JavaScript, internal JavaScript and external JavaScript. Show one example for each method and explain when each method should be used.
Hint: Use onclick for inline, script tag inside head or body for internal, and separate js file for external.

---

2. Compare inline, internal and external JavaScript practically

Create three separate HTML pages each using one method of adding JavaScript. Observe maintainability and scalability differences.
Hint: Think about large project structure and code reusability.

---

3. Create HTML page demonstrating script tag placement difference

Create one page where script is placed inside head and another where script is placed before closing body tag. Compare behavior.
Hint: Try accessing DOM element before it loads.

---

4. Demonstrate use of defer attribute

Create HTML page where script is placed in head using defer attribute and access DOM elements successfully.
Hint: Compare it with script without defer.

---

5. Demonstrate use of async attribute

Create example showing async script loading and explain difference between async and defer.
Hint: Use console log statements to observe execution order.

---

6. Create console debugging demo

Create page with multiple console log, console error and console warn statements.
Hint: Use browser developer tools and inspect console tab.

---

7. Create first JavaScript program showing output in three ways

Write program that displays message using alert, console log and document write.
Hint: Compare which method is recommended in real projects.

---

8. Create program to display current date and time in console

Write JavaScript program that prints current date and time in console when page loads.
Hint: Use built in Date object.

---

9. Create button click event using external JavaScript file

Create button in HTML and write JavaScript in external file to display message on click.
Hint: Use event listener instead of inline onclick.

---

10. Demonstrate error debugging example

Create JavaScript program with intentional error and debug it using browser console.
Hint: Misspell variable name and observe error message.

---

11. Create simple calculator using internal script

Create simple addition calculator using internal script and display result on button click.
Hint: Access input values using DOM methods.

---

12. Demonstrate difference between blocking and non blocking script

Create example showing how script in head without defer blocks page rendering.
Hint: Add large loop to observe delay.

---

13. Create structured external JavaScript project setup

Create small project structure with separate HTML, CSS and JS files properly linked.
Hint: Follow clean folder structure.

---

14. Explain execution order of multiple script tags

Create HTML page with multiple script tags and observe execution order.
Hint: Add console log in each script.

---

15. Create mini demo project using best practices

Create small webpage with external JS, use defer attribute, use console for debugging and avoid inline JS.
Hint: Follow clean coding practices.
