JAVASCRIPT ASSIGNMENT : 06

Module 6: Functions – Multiple Assignment Questions

Section 1: Function Declaration

---

1. Create simple function to print welcome message

Create function using function declaration that prints welcome message when called.
Hint: Define function separately and call it later.

---

2. Create function to add two numbers

Create function that accepts two parameters and returns their sum.
Hint: Use return keyword.

---

3. Create function to check even or odd

Create function that takes number and returns whether it is even or odd.
Hint: Use modulus inside function.

---

4. Create function to calculate factorial

Create function that takes number and returns factorial value.
Hint: Use loop inside function.

---

5. Create function to find largest of three numbers

Function should accept three parameters and return largest number.
Hint: Use conditional statements inside function.

Section 2: Function Expression

---

6. Create function expression to calculate square

Create function using function expression that returns square of number.
Hint: Store function inside variable.

---

7. Create function expression to reverse string

Create function that accepts string and returns reversed string.
Hint: Use loop inside function.

---

8. Create function expression and call it before declaration

Try calling function expression before it is defined and observe result.
Hint: Understand hoisting behavior.

---

9. Compare function declaration and function expression

Create small program demonstrating difference in hoisting.
Hint: Call both before definition.

Section 3: Arrow Functions

---

10. Convert normal function to arrow function

Take simple addition function and convert it to arrow function.
Hint: Remove function keyword and use arrow syntax.

---

11. Create arrow function with single parameter

Create arrow function that returns cube of number.
Hint: Parentheses optional for single parameter.

---

12. Create arrow function without return keyword

Create arrow function that returns multiplication result using short syntax.
Hint: Use implicit return.

---

13. Compare this behavior in normal vs arrow function

Create object with method using normal function and arrow function and compare this behavior.
Hint: Observe context binding.

Section 4: Parameters and Return Values

---

14. Create function with multiple parameters

Create function that calculates total bill with tax percentage passed as parameter.
Hint: Return final value.

---

15. Create function returning boolean

Create function that checks whether number is prime and returns true or false.
Hint: Use loop inside function.

---

16. Create function returning object

Create function that takes name and age and returns object containing those values.
Hint: Return object literal.

Section 5: Default Parameters

---

17. Create function with default parameter

Create function that greets user. If no name passed, default name should be Guest.
Hint: Assign default value in parameter list.

---

18. Create calculator function with default operator

Create function that takes two numbers and operator parameter with default as addition.
Hint: If operator not passed, perform addition.

Section 6: Callback Functions Intro

---

19. Create function that accepts another function as parameter

Create function that accepts callback and executes it after printing message.
Hint: Call callback inside main function.

---

20. Create calculator using callback

Create function that takes two numbers and callback function to perform operation.
Hint: Pass different operation functions.

---

21. Create simple timeout callback example

Create example where message prints after few seconds.
Hint: Use built in timeout function.

Section 7: Interview Level Thinking Questions

---

22. What is difference between return and console log

Create function and compare output when using return and console log.
Hint: Return sends value back, console only prints.

---

23. Can function return multiple values

Create example returning array or object as multiple values.
Hint: JavaScript returns single value but can pack multiple in object or array.

24. What happens if function does not return anything

Create function without return and print result.
Hint: Observe returned value.

25. Write program showing pure and impure function

Create one function that depends only on parameters and one that depends on external variable.
Hint: Compare predictability
