JAVASCRIPT ASSIGNMENT : 08

Module 8: Objects – Multiple Assignment Questions

Section 1: Creating Objects

---

1. Create simple student object

Create object storing student name, age and marks. Print all values.
Hint: Use object literal syntax.

---

2. Create object using constructor function

Create student object using constructor function and create multiple instances.
Hint: Use this keyword inside constructor.

---

3. Create nested object

Create object where address is another object inside main object. Print city value.
Hint: Access nested property step by step.

---

4. Create array of objects

Create array containing multiple student objects and print each student name.
Hint: Use loop to iterate array.

---

5. Add new property dynamically

Create object and add new property after object creation.
Hint: Use dot notation.

Section 2: Properties and Methods

---

6. Create object with method

Create object that contains method to display full name.
Hint: Method is function inside object.

---

7. Create object method using this keyword

Create object with name and method that prints name using this keyword.
Hint: this refers to current object.

---

8. Create calculator object

Create object with add subtract multiply divide methods.
Hint: Define multiple methods inside object.

---

9. Create product object with discount method

Create product object with price and method to calculate discounted price.
Hint: Use this.price inside method.

---

10. Modify object property inside method

Create object with balance and method to update balance amount.
Hint: Use this to update value.

Section 3: Dot vs Bracket Notation

---

11. Access object properties using dot and bracket notation

Create object and access same property using both methods.
Hint: Bracket useful for dynamic keys.

---

12. Access dynamic property using variable

Create object and store property name in variable and access using bracket notation.
Hint: Dot notation will not work here.

---

13. Loop through object properties

Print all keys and values of object using loop.
Hint: Use for in loop.

Section 4: Object Destructuring

---

14. Basic object destructuring

Create object and extract values into variables using destructuring.
Hint: Variable names must match property names.

---

15. Rename variables during destructuring

Destructure object but rename variables.
Hint: Use colon syntax.

---

16. Destructure nested object

Create nested object and extract nested value using destructuring.
Hint: Destructure step by step.

---

17. Destructure function parameters

Create function that accepts object and destructures properties inside parameter list.
Hint: Use destructuring directly in function argument.

Section 5: this Keyword Intro

---

18. Demonstrate this inside object method

Create object and print this inside method.
Hint: It refers to calling object.

---

19. Compare normal function and arrow function inside object

Create object method using normal function and arrow function and compare this behavior.
Hint: Arrow does not bind its own this.

---

20. Use this inside constructor function

Create constructor and access properties using this.
Hint: Use new keyword while creating object.

Section 6: Real World Logical Questions

---

21. Create bank account object

Create object with account holder name, balance and deposit withdraw methods.
Hint: Update balance using this.

---

22. Create shopping cart object

Create object that stores products and method to calculate total bill.
Hint: Use array inside object.

---

23. Create employee management object

Create object storing employees array and method to add new employee.
Hint: Push new object inside array.

---

24. Create student result analyzer

Create object that stores student marks and method to calculate average.
Hint: Loop through marks array.

---

25. Merge two objects

Create two objects and merge them into one object.
Hint: Use spread operator.

---

26. Clone object without modifying original

Create object and clone it then modify clone and check original.
Hint: Use spread syntax.

---

27. Check if property exists in object

Write program to check if property exists in object.
Hint: Use in operator.

---

28. Remove property from object

Create object and remove specific property.
Hint: Use delete keyword.

---

29. Count number of properties in object

Create object and count total keys.
Hint: Use Object keys method.

---

30. Convert object to array and array to object

Write program converting object to array of keys and convert array back to object.
Hint: Use built in object methods.
