JAVASCRIPT ASSIGNMENT : 10

Module 10: DOM Basics – Multiple Assignment Questions

Section 1: DOM Concept Understanding

---

1. Explain DOM with practical example

Create simple HTML page and explain how JavaScript accesses and modifies elements using DOM.
Hint: Access element and change its text content.

---

2. Create DOM tree explanation

Create simple HTML structure and draw or explain its DOM tree structure.
Hint: Understand parent child relationship.

Section 2: getElementById Based Questions

---

3. Change text content using getElementById

Create HTML with heading and change its text using button click.
Hint: Use textContent property.

---

4. Change background color using getElementById

Create div and change its background color on button click.
Hint: Use style property.

---

5. Toggle visibility of element

Create paragraph and hide show it using button.
Hint: Change display property.

---

6. Create simple counter

Create counter with increase and decrease buttons.
Hint: Update textContent value.

Section 3: querySelector Based Questions

---

7. Select element using class

Create multiple elements and change style of first matching element using querySelector.
Hint: Use class selector.

---

8. Change image source dynamically

Create image and change its source when button clicked.
Hint: Use src property.

---

9. Create theme switcher

Create light and dark mode switch using querySelector.
Hint: Change body class or background style.

---

10. Add class to element

Create button that adds specific class to div on click.
Hint: Use classList add method.

Section 4: querySelectorAll Based Questions

---

11. Change color of multiple elements

Create multiple paragraphs and change color of all using querySelectorAll.
Hint: Loop through node list.

12. Add click event to multiple buttons

Create multiple buttons and add event to each using querySelectorAll.
Hint: Use loop to attach event.

13. Highlight all list items

Create list and highlight all items when button clicked.
Hint: Use forEach on selected elements.

Section 5: Changing Content and Styles

14. Create live text preview

Create input field and display typed text in paragraph in real time.
Hint: Use input event and textContent.

15. Create color changer box

Create box and allow user to change its color using input field.
Hint: Change style backgroundColor dynamically.

16. Create dynamic font size changer

Create text and buttons to increase and decrease font size.
Hint: Modify style fontSize property.

Create form and show error message if input is empty.
Hint: Change textContent and style color.

18. Create dynamic list app

Create input field and button. On click add new list item to unordered list.
Hint: Create element and append child.

---

19. Remove element dynamically

Create list and remove specific item on button click.
Hint: Use remove method.

---

20. Create simple tab switching UI

Create three tabs and show different content when clicked.
Hint: Change display property.

Section 6: Real World Mini Project Style

---

21. Create simple to do list app

Add tasks delete tasks and mark completed.
Hint: Use DOM selection and class toggling.

---

22. Create image gallery with click preview

Click thumbnail and show large image preview.
Hint: Change src dynamically.

---

23. Create password show hide toggle

Create password input and toggle visibility.
Hint: Change input type attribute.

---

24. Create character counter for textarea

Show remaining character count dynamically.
Hint: Use length property.

---

25. Create simple quiz app

Create multiple choice questions and show score at end.
Hint: Change content dynamically.
