JAVASCRIPT ASSIGNMENT : 11

Module 11: DOM Events – Multiple Assignment Questions

Section 1: Event Handling Basics

---

1. Create button click event using onclick

Create button and show message when clicked using onclick attribute.
Hint: Use inline event first.

---

2. Create button click event using addEventListener

Create same functionality using addEventListener method.
Hint: Separate HTML and JS.

---

3. Compare onclick and addEventListener practically

Create example where multiple click events are attached to same button.
Hint: onclick overrides previous handler but addEventListener does not.

---

4. Create double click event

Create div and change its color when double clicked.
Hint: Use dblclick event.

Section 2: click Event Based Questions

---

5. Create counter app using click event

Create increase and decrease button to update number.
Hint: Update textContent on click.

---

6. Create show hide password toggle

Create password input and toggle visibility on button click.
Hint: Change input type.

---

7. Create dynamic list item removal

Create list and remove clicked item using event.
Hint: Use event target.

Section 3: change Event Based Questions

---

8. Create dropdown selection display

Create select dropdown and show selected value below.
Hint: Use change event.

---

9. Create background color changer using dropdown

Create dropdown of colors and change page background on selection.
Hint: Access selected value.

---

10. Create checkbox based toggle

Create checkbox and show hide element based on checked state.
Hint: Use checked property.

Section 4: submit Event Based Questions

---

11. Create simple form validation

Create form and prevent submission if input empty.
Hint: Use preventDefault method.

12. Display form data without page refresh

Create form and display submitted data on page without reload.
Hint: Use submit event and preventDefault.

13. Create login form validation

Check username and password and show error message dynamically.
Hint: Use conditional logic inside submit event.

Section 5: keyup Event Based Questions

14. Create live search filter

Create input field and filter list items as user types.
Hint: Use keyup event.

15. Create live character counter

Create textarea and show character count while typing.
Hint: Use value length inside keyup.

16. Create uppercase converter

Convert input text to uppercase in real time.
Hint: Modify value on keyup.

Section 6: Event Object Based Questions

17. Display clicked element text using event object

Create multiple buttons and show text of clicked button.
Hint: Use event target.

---

18. Prevent link default behavior

Create link and prevent navigation on click.
Hint: Use preventDefault.

---

19. Stop event propagation example

Create nested elements and demonstrate event bubbling.
Hint: Use stopPropagation method.

---

20. Display mouse position on click

Display X and Y coordinates when user clicks on page.
Hint: Use event object properties.

Section 7: Real World Mini Projects

---

21. Create to do list with event delegation

Add and remove tasks dynamically using event delegation.
Hint: Attach event to parent.

---

22. Create image slider using click events

Create manual slider using next and previous buttons.
Hint: Change image source dynamically.

---

23. Create modal popup system

Create modal that opens and closes using click events.
Hint: Toggle class on click.

---

24. Create simple quiz using events

Create quiz where answer selected triggers next question.
Hint: Use click event for options.

---

25. Create interactive rating system

Create star rating system where clicking star highlights rating.
Hint: Use event target and loop.
